

Attachment Disorder

Description of Reactive Attachment Disorder

Definition

Reactive attachment disorder (RAD) is categorized as a Trauma- and Stressor-Related Disorder in the *Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition* (DSM-5; American Psychiatric Association [APA], 2013). A RAD diagnosis can be a guide to clinicians who are concerned about neglect by caregiver

clinical research, a critical and accurate analysis of RAD. Further, RAD also affects the ability to establish a connection with others, leading to social isolation. The clinical research on RAD is still in its early stages, and more research is needed to understand the disorder better. It is important to note that RAD is not a mental illness, but a developmental disorder. The clinical research on RAD is still in its early stages, and more research is needed to understand the disorder better. It is important to note that RAD is not a mental illness, but a developmental disorder.
